

# Integrative Negotiation in Complex Organizational Agent Systems

Xiaoqin Zhang  
University of Massachusetts at Dartmouth  
Victor Lesser  
University of Massachusetts at Amherst  
Tom Wagner  
Honeywell Laboratories

## Outline

- Background
- Motivation
- Motivational Quantities
- Integrative negotiation mechanism
- Experimental results
- Future work

# Agents and Multi-Agent Systems

- Multi-agent system – intelligent agents interacting
- Agent – complex and large-grained
  - Multiple tasks – scheduling
  - Complex tasks – planning
  - Soft real-time concerns
- Applications
  - Agent-mediated electronic commerce
  - Supply-chain management
  - Distributed sensor network
  - Intelligent environment control

# Negotiation in MAS

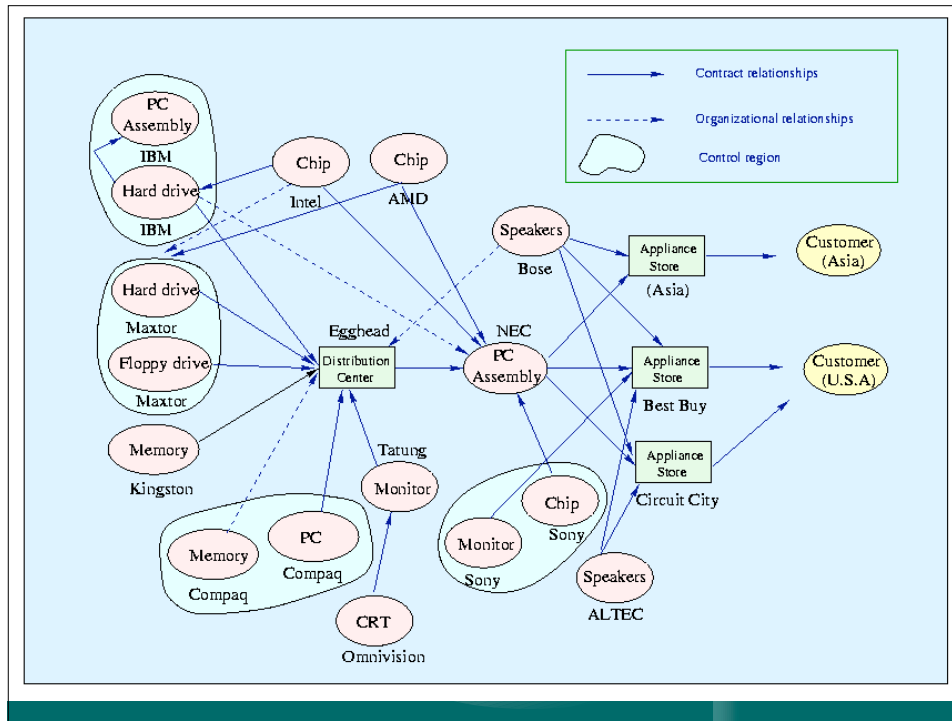

- Negotiation – an interactive communication
  - Task allocation
  - Resource allocation
  - Conflict resolution
- Research on Negotiation
  - Negotiation language: communication part including primitive, semantics, protocols, and topics, etc.
  - Negotiation decision: evaluation process, how to select bids, strategies.
  - Negotiation process: negotiation behavior, models, etc.

## Two major trends

- Competitive negotiation
  - agents are self-interested and negotiate to maximize their own local utility
  - social welfare is not a concern
  - Example: TRACONET, leveled commitment [sandholm & Lesser,96]
- Cooperative negotiation
  - agents work to find a solution that increases their joint utility or solve conflict
  - no notion of individual agent utility
  - Example: Distributed meeting scheduling [sen96]

## Organization Structures

- simple market systems
- distributed problem solving systems
- Dynamically formed virtual organizations
- Involved concurrently with more than one virtual organization
- Pure self-interested may hurt repeated transactions
- Bounded rationality prevents fully cooperative

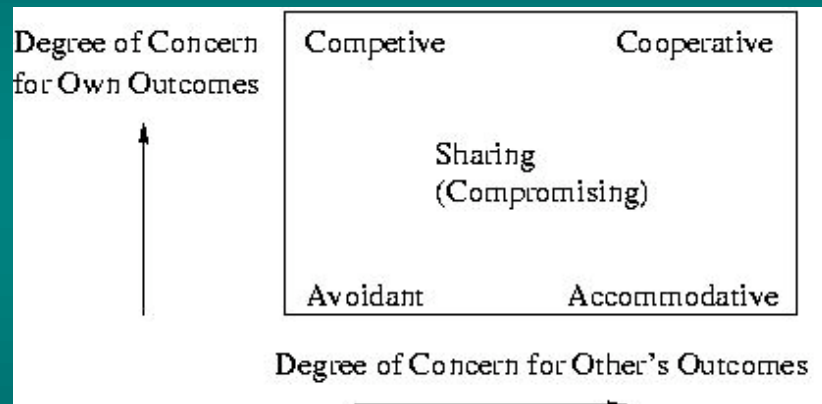

## Different partners

Agent\_IBM\_2 provides hard drives for:

- agent\_IBM\_1, who belongs to IBM but assembles PC.
- A NEC agent, a virtual organization formed based on the recent more frequent transactions.
- a distributor center, occasionally, based on a simple marketing mechanism.

## Dual concern model

R. Lewicki and J. Litterer, 1985, Negotiation

## What is needed?

- The agent can choose from many different negotiation strategies in the spectrum from purely self-interested to accommodative.
- The choice should depend on the agent's organizational goals and the current environmental circumstance.
- No requirement of a centralized controller which coordinates the agent's behavior.

## What have been done? - brownie point

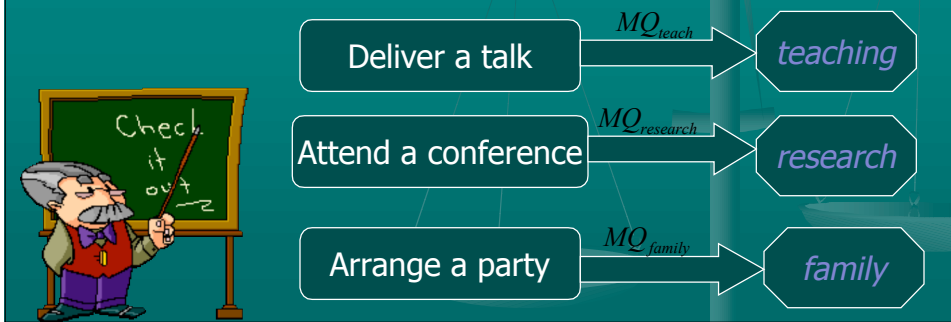

- Brownie points [Glass and Grosz 00], a measure of social consciousness
- Agent belongs to a group, receives both group tasks and outside offers.
- Agent collects brownie points by not defaulting group task.
- BP-weight: varying levels of social consciousness.
- A central mechanism controlling the assignment of group tasks according to agent's rank.

## What have been done? - reciprocity

- Probabilistic reciprocity mechanism [Sen,96]
- Reciprocity: promote cooperative behavior among self-interested agents
- Probability of accepting a request depends on:
  - extra cost of this cooperation behavior
  - how much effort it owes
  - Adjustable parameters allow agent choose a specific cooperation level
- Assumes that cooperation always leads to aggregate gains for the group; no organizational structure.

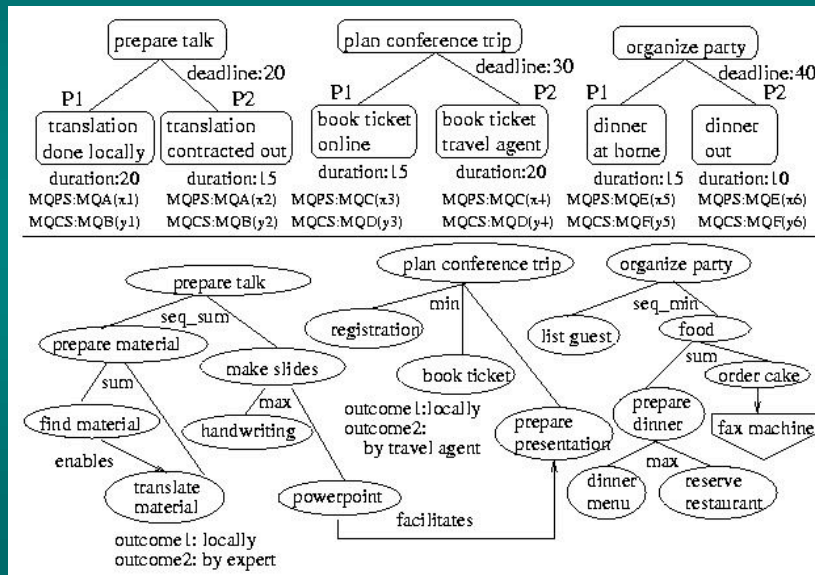

# Motivational Quantities

- Agent has multiple roles, multiple goals
- MQ represents progress towards organizational goal
- Preference function  $F_i$ :  $MQ_i \rightarrow$  utility

# Schedule on MQ Tasks

MQ scheduler: select task to maximize utility

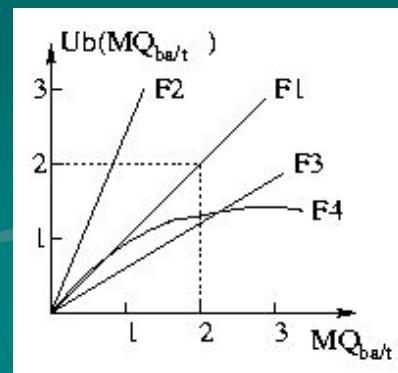

## Two types of MQ

- Goal related MQ
  - Mapped into agent's utility, utility function is determined by agent designer
  - Transferred between agents who have the same organizational goal.
- Relational MQ
  - Mapped into "virtual" utility
  - Utility curve reflects the relationship between agents

## Relational MQ

- Relational MQ (*motivational quantity*)
  - Transferred from agent A to B with task t
  - How important task t is for agent A
  - How much agent B cares
  - Function F1: completely cooperative
  - Function F2: accommodative (over cooperative)
  - Function F3: partially cooperative (half cooperative)
  - Function F4: first cooperative, then indifferent

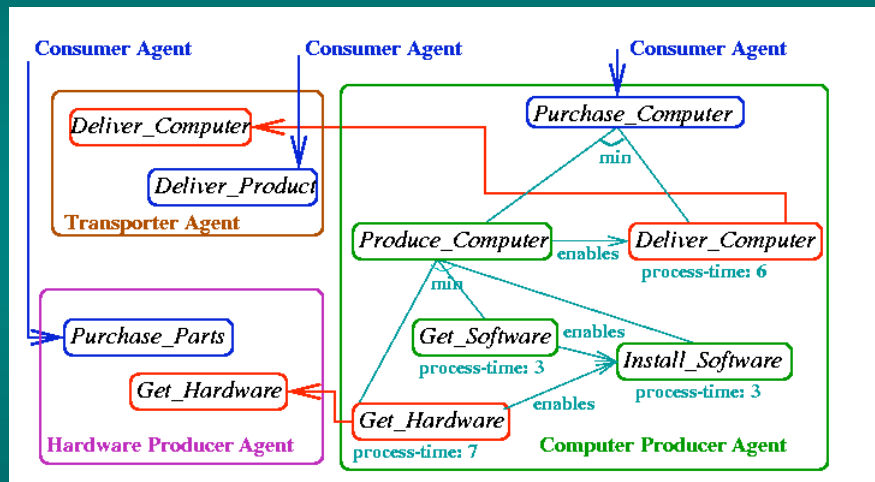

# Integrative Negotiation

- Agents negotiate
  - With agents from different organizations, different roles, authority relationships
  - Concern different issues
- Dynamic strategies
  - Wide range of selections
  - Depends on negotiation party and issue
  - Related to organizational concerns

# PCT Scenario

## Computer producer agent Get a contract

task name : Purchase\_Computer\_A  
 est: 10  
 deadline: 70  
 reward: 20 units MQ\$  
 early finish reward rate: e=0.01  
 Finish time: 40  
 Early reward: (70-40)\*0.01\*20=6

<i>task name</i>	<i>Get_Hardware_A</i>	<i>Deliver_Computer_A</i>
<i>est</i>	10	30
<i>deadline</i>	20	40
<i>reward</i>	3 units MQ\$ 10 units MQ <sub>hc/t</sub>	3 units MQ\$ 10 units MQ <sub>tc/t</sub>
<i>e</i>	0.01	0.01

## Hardware agent What should I do?

<i>task name</i>	<i>est</i>	<i>deadline</i>	<i>process time</i>	<i>MQPS</i>
<i>Get_Hardware_A</i>	10	20	10	[MQ\$,3] [MQ <sub>hc/t</sub> ,10]
<i>Purchase_Parts_A</i>	10	30	10	[MQ\$,4]
<i>Purchase_Parts_B</i>	10	20	10	[MQ\$,9]

$$U_{ha}(MQ_{hc/t}) = k * MQ_{hc/t}$$

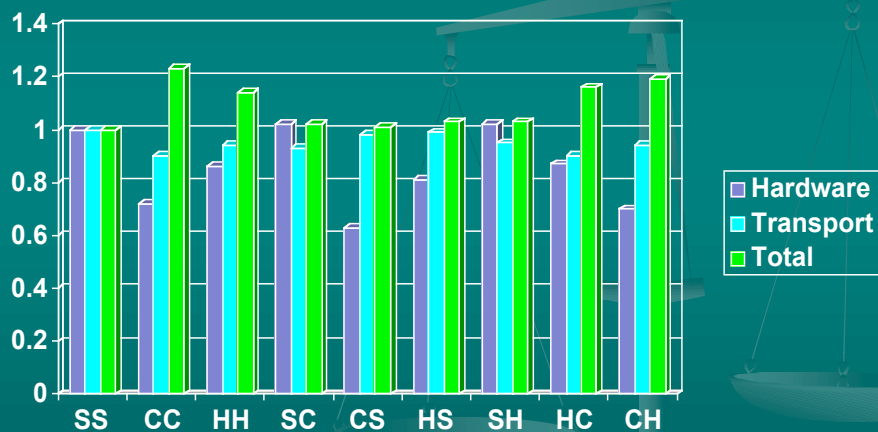

- **k=1, completely-cooperative**  
 [10, 20] Get\_Hardware\_A [20, 30] Purchase\_Parts\_A
- **k=0.5, half-cooperative** (partial cooperati  
 [10, 20] Purchase\_Parts\_B [20, 30] Purchase\_Parts\_A
- **k=0, self-interested**  
 [10, 20] Purchase\_Parts\_B [20, 30] Purchase\_Parts\_A

## Experimental Setup

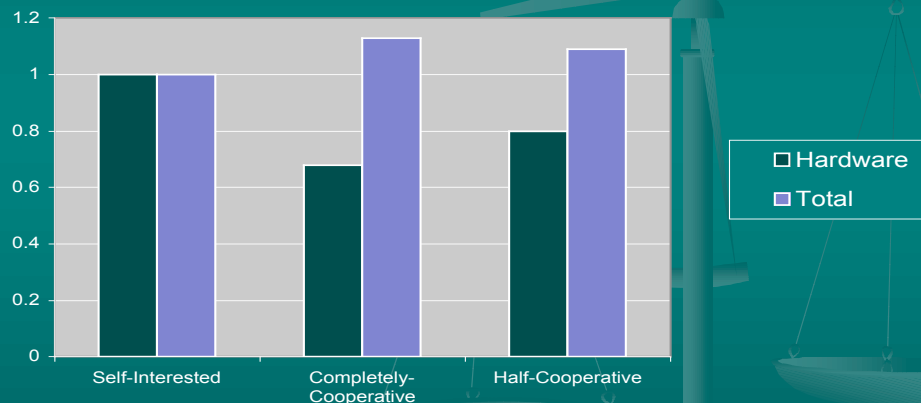

- Agent society: computer producer agent, hardware agent, transport agent
- Three attitudes: completely-cooperative (C), half-cooperative (H), and self-interested (S)
- Nine combinations: CC, HH, SS, HC, CH, HS, SH, CS, SC
- comparison of each agent's utility and the social welfare under different situations

## Cooperation not always help

S: self-interested  
C: completely cooperative  
H: half cooperative

## Be conservative when works with unknown agents

## Uncertainty play a role

- Uncertainty comes from lack of information
  - The other agent's attitude
  - How good is its outside offer, and frequency
- Fully cooperative is impossible given complete global information is not available

## Uncertainty in the organization environment

## Alternative view of MQ

- Another reason of uncertainty in a distributed system: uncertainty about the relationships with other agents
- MQ can be used as a means to deal with this uncertainty
  - Dynamically adjust MQ (the agent's attitude) towards another agent based on how certain/uncertain it is about the other's commitment to itself

## Conclusions and Future Work

- Integrative negotiation with attitude from self-interested to complete cooperative
- In a uniform reasoning framework
- Model human society
- How should an agent select its attitude?  
Learning from experience?
