Intelligent Agent – An AI Perspective

- From AI perspective, an agent is a computer system situated in some environment, that is capable of flexible, autonomous actions in order to meet its design objectives
- Agent properties include
 - Situatedness (reactiveness)
 - Autonomy (proactiveness)
 - Sociability (responsibility, communication capability, organization capability, etc.)

10/21/2005

CIS Dept., UMass Dartmouth

4

Software Agent – A Software Engineering Perspective

- From software engineering perspective, an agent can be considered as an *active* object, i.e., an object with a mental state
- A software agent is a program that acts on behalf of (human) user
- Example: air ticket seller agent and air ticket buyer agent in e-commerce

10/21/2005

CIS Dept., UMass Dartmouth

5

Open Multi-Agent System

- Multi-agent system (MAS) is a concurrent software system with more than one agent
- A traditional MAS consists of a fixed number of software agents
- In an open MAS, agents can
 - join or leave an agent society at will
 - take or release roles dynamically

10/21/2005

CIS Dept., UMass Dartmouth

6

An Example (Simulating a Company)

- Employee 1:
 - TeamLeader_1
 - P_1.1
- Employee 2:
 - P_1.m
 - P_2.2
- Employee X:
 - ...

10/21/2005

CIS Dept., UMass Dartmouth

7

Role-Based Modeling

- Role-based modeling is one of the most effective methodologies for agent-based system analysis and design
- In most of the existing work
 - abstract constructs used to conceptualize and understand the system
 - no realizations in the implemented system
 - Suitable for closed multi-agent systems
- We propose a methodology for role-based modeling of open multi-agent systems

10/21/2005

CIS Dept., UMass Dartmouth

8

An Organizational Approach

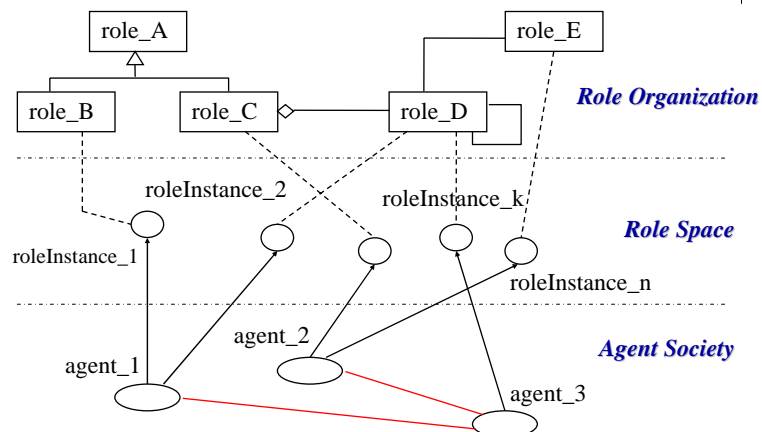

- Separate the concepts of role organization and role space
 - role organization contains conceptual roles
 - role space contains role instances
- At the third layer, we define an agent society that consists of agent instances
- The agent society can be designed independently of the role organization and role space

10/21/2005

Formal Specifications - Role and Role Organization

Role
$attributes : \mathbb{P} \text{Attribute}$ $goals : \mathbb{P} \text{Goal}$ $plans : \mathbb{P} \text{Plan}$ $actions : \mathbb{P} \text{Action}$ $permissions : \mathbb{P} \text{Permission}$ $protocols : \mathbb{P} \text{Protocol}$ $beTaken : \mathbb{B}$
<i>INIT</i> $permissions = \emptyset$ $protocols = \emptyset$ $beTaken = false$
<i>setPermission</i> $\Delta permissions$ $perm? : \text{Permission}$ $permissions' = permissions \cup \{perm?\}$
<i>addProtocol</i> $\Delta protocols$ $prot? : \text{Protocol}$ $protocols' = protocols \cup \{prot?\}$

RoleOrganization
$roles : \mathbb{P} \downarrow \text{RoleMetaClass}$ $relationship : \downarrow \text{RoleMetaClass} \times \downarrow \text{RoleMetaClass} \leftrightarrow \text{Relationship}$ $\forall r1, r2 \in roles, r1 \neq r2 \bullet (r1, r2) \in \text{dom } relationship$
<i>INIT</i> $roles = \{Role\}$
<i>addRole</i> $\Delta roles, relationship$ $role? : \downarrow \text{RoleMetaClass}$ $role? \notin roles \wedge roles' = roles \cup \{role?\}$ $\exists r \in roles \bullet relationship' = relationship \cup \{(r, role?) \mapsto inheritance\}$
<i>setRelationship</i> $\Delta relationship$ $r1?, r2? : \downarrow \text{Role}$ $rela? : \text{Relationship}$ $r1?, r2? \in roles \wedge rela? \neq inheritance \wedge relationship' = relationship \cup \{(r1?, r2?) \mapsto rela?\}$

10/21/2005

CIS Dept., UMass Dartmouth

11

Formal Specifications - Role Space and Agent

RoleSpace
$roleOrganization : \text{RoleOrganization}$ $\#roleOrganization.roles > 1$
$roleInstances : \mathbb{P} \downarrow \text{Role}$ $\forall ri \in roleInstances \bullet ri.getClass \in roleOrganization.roles$
<i>INIT</i> $roleInstances = \emptyset$
<i>createRoleInstance</i> $\Delta roleInstances$ $ri? : \downarrow \text{Role}$ $ri?.getClass \in roleOrganization.roles$ $ri? \notin roleInstances \wedge roleInstances' = roleInstances \cup \{ri?\}$
<i>deleteRoleInstance</i> $\Delta roleInstances$ $ri? : \downarrow \text{Role}$ $ri? \in roleInstances \wedge roleInstances' = roleInstances - \{ri?\}$
<i>findRoleInstance</i> $\exists roleInstances$ $ra? : \text{Role.Attribute}$ $ri! : \downarrow \text{Role}$ $(\text{NotFound} \wedge ri! = null) \vee \exists ri \in roleInstances \bullet ri.attributes = ra? \wedge ri! = ri$

Agent
$attributes : \mathbb{P} \text{Attribute}$ $motivations : \mathbb{P} \text{Motivation}$ $sensor : \text{Environment} \leftrightarrow \text{SensorData}$ $reasoningMechanism : \mathbb{P} \text{SensorData} \times \mathbb{P} \text{Motivation} \rightarrow \mathbb{P} \text{Goal} \rightarrow \mathbb{P} \downarrow \text{Role}$ $rolesTaken : \mathbb{P} \downarrow \text{Role}$
<i>INIT</i> $rolesTaken = \emptyset$
<i>takeRole</i> $\Delta rolesTaken$ $ri? : \downarrow \text{Role}$ $ri?.beTaken = false \wedge ri?.beTaken' = true$ $ri? \notin rolesTaken \wedge rolesTaken' = rolesTaken \cup \{ri?\}$
<i>releaseRole</i> $\Delta rolesTaken$ $ri? : \downarrow \text{Role}$ $ri?.beTaken = true \wedge ri?.beTaken' = false$ $ri? \in rolesTaken \wedge rolesTaken' = rolesTaken - \{ri?\}$

Role-Based MAS Design

- Design *Role* classes and their relationships
 - inheritance relationship
 - aggregation relationship
 - association relationship
 - incompatibility relationship
- To ease software engineer's effort, we propose a design process for MAS development

10/21/2005

CIS Dept., UMass Dartmouth

13

A Generic Procedure to Design Open MAS

1. Design the set of *Role* classes Ω and their relationship $\Pi 1: \Omega \times \Omega \rightarrow [IH \mid AG]$, where IH and AG represent the relationship types of *inheritance* and *aggregation*, respectively.
2. Design the role organization Φ according to the class schema *RoleOrganization*, and define any *association* relationships and *incompatibility* relationships between classes, i.e., $\Pi 2: \Omega \times \Omega \rightarrow [AS \mid IC]$, where AS and IC represent the relationship types of *association* and *incompatibility*, respectively.
3. Design the role space Γ according to the class schema *RoleSpace*. The role space Γ should support creating, advertising, and searching for role instances. It may use existing middleware, e.g., Sun Jini, for its purpose.
4. Refine the *Agent* class with a set of sensors and a set of appropriate reasoning mechanisms. This step may overlap with Step 1-3.
5. Design agent society Θ according to the class schema *AgentSociety*. The agent society Θ contains a set of agent instances of type *Agent*, and it corresponds to the role organization Φ with the same organization/society design purpose.

10/21/2005

CIS Dept., UMass Dartmouth

14

Open Role Space and Open Agent Society

- Open role space
 - role instances can be added into or deleted from a role space dynamically
- Open agent society
 - agents can join or leave the system at will
 - agents can take or release role instances in a role space dynamically

10/21/2005

CIS Dept., UMass Dartmouth

15

A-R Mapping

- *A-R mapping* is a process for agents from an agent society Θ to take or release role instances in a role space Γ .
- Both of agent society Θ and role space Γ are defined upon the role organization Φ .
- Formally, the *A-R mapping* is defined as follows

$$A-R \text{ mapping} \hat{=} f : Agent \rightarrow \mathbb{P} \downarrow Role$$

where f is a partial function mapping from an agent instance to a set of role instances.

10/21/2005

CIS Dept., UMass Dartmouth

16

The Process of A-R Mapping

1. *Initialization*: The agent society Θ makes a request to the role space Γ to instantiate the major *LeadingRole* class defined in the role organization Φ , and create a role instance for it.
2. *Role assignment*: for each agent α in the agent society Θ , do the following:
 - a. When agent α receives any sensor data from its environment, it may decide to generate some new goals or subgoals based on the sensor data and agent α 's motivations.
 - b. With its reasoning mechanisms, agent α further deduce a set Ω of needed roles of types defined in the role organization Φ . If none of the roles in set Ω is of type *LeadingRole*, go to step 2.d.
 - c. If any role in role set Ω is a leading role of type *LeadingRole*, agent α takes the corresponding role instance from the role space Γ , if available, updates the hiring number of other roles as needed, and makes requests to the role space Γ to create role instances for those roles under hiring.
 - d. Repeat the following for a period of time T : Search the role space Γ for any role instances that match roles in role set Ω . If there is a match, agent α takes that role instance. If all roles in role set Ω have been matched with some role instances in the role space Γ , go to Step 3.
 - e. If any role in the role set Ω cannot be matched with a role instance in the role space Γ , agent α may decide to release all role instances or keep its current occupations.
3. *Marking role incompatibility*: for each agent α , mark its role incompatibility as the following: for any role instances $r1, r2 \in \alpha.rolesTaken$, if $\Phi.relationship(r1.getClass, r2.getClass) == incompatibility$, mark agent α as potential *role incompatibility* with a self-loop.
4. *Setting up interaction relationships*: for each agent α , set up the interaction relationship between agent α and other agents from the same agent society Θ as the following : for any agent instance $\beta \in \Theta.agentInstances$, where $\alpha \neq \beta$, if $\exists r1 \in \alpha.rolesTaken, r2 \in \beta.rolesTaken$ such that $\Phi.relationship(r1.getClass, r2.getClass) == association$, then $(\alpha, \beta) \in dom \Theta.interaction$.

18

Development of Open MAS

- “The sooner you start, the longer it takes.”
by Fred Brook
 - Need to spend time on requirements capture
 - Need to spend time on software design
- Propose our model-driven development of open MAS
- Develop a Role-based Agent Development Environment (RADE) to support rapid application development (RAD).

10/21/2005

CIS Dept., UMass Dartmouth

19

Model-Driven Development of Role-Based Open MAS

- Inspired by the Model-Driven Architecture (MDA), proposed by OMG
- We propose a three layered development model
 - Separation of concerns: architecture domain, application domain, solution domain
 - Support automatic or semi-automatic rapid application development (RAD) of open MAS

10/21/2005

CIS Dept., UMass Dartmouth

20

Three Layered Development Model

AIPIM (Application Independent Platform Independent Model)

ASPIM (Application Specific Platform Independent Model)

ASPSM (Application Specific Platform Specific Model)

10/21/2005

CIS Dept., UMass Dartmouth

21

Application Independent Platform Independent Model (AIPIM)

- Defines a high level of abstraction that is independent of any particular applications and any implementation technology
- An AIPIM is typically suitable for a set of applications
 - Mobile agent model
 - Multi-agent system model
 - Role-based agent model

10/21/2005

CIS Dept., UMass Dartmouth

22

Application Specific Platform Independent Model (ASPIM)

- Defines a high level of abstraction
 - Specific to a particular application
 - Independent of any implementation technology
- Needs application domain knowledge
- Describes a software system that supports some business logic.

10/21/2005

CIS Dept., UMass Dartmouth

23

Application Specific Platform Specific Model (ASPSM)

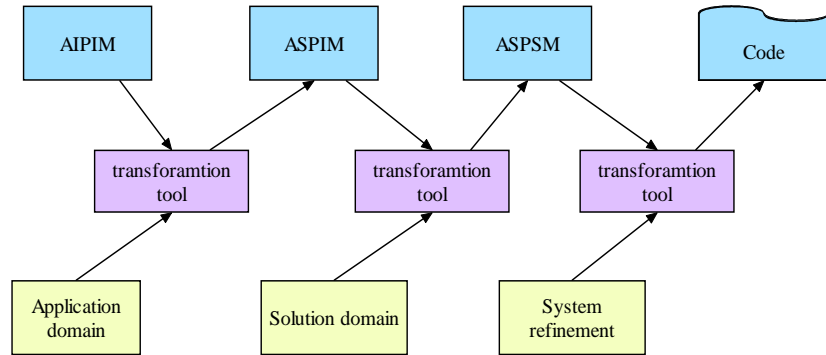

- Defines an abstraction of the software system
 - Specific to a particular application
 - Specific to an implementation technology
- Specifies the software system in terms of some specific implementation technology
 - J2EE, EJB, Java Servlets
 - Microsoft .Net, C#
 - IBM Websphere, web services technology

10/21/2005

CIS Dept., UMass Dartmouth

24

Model-Driven Development Process

10/21/2005

CIS Dept., UMass Dartmouth

25

Transformation between Two Models

source model → target model

10/21/2005

CIS Dept., UMass Dartmouth

26

Example: Transformation Definition

- Suppose model A is written in UML and model B is a relational database model
- A transformation definition that translates an association in UML into a foreign key relation may look as follows

10/21/2005

CIS Dept., UMass Dartmouth

27

A Transformation Rule

```
if the association A to B is adorned by an association class  
or the multiplicity at both ends is more-than-one  
then create a table representing the association class or the  
association  
and create foreign keys in both the table representing A  
and the table representing B referring this new table  
else if the multiplicity at one end is zero-to-one  
then create a foreign key in the table representing the  
class at that end, referencing the other end  
else // the multiplicity of the association is one-to-one  
create a foreign key in one of the tables,  
referencing the other end  
end if  
end if
```

Case Study: Organizing a Conference

- Involves the following major processes
 - Submit papers by authors
 - Assign program committee members
 - Assign primary program committee members
 - Assign papers to (primary) program committee members
- Goal: Automate (or semi-automate) the above processes using agent technology

An Open MAS for Organizing a Conference

Design of the AIP Model

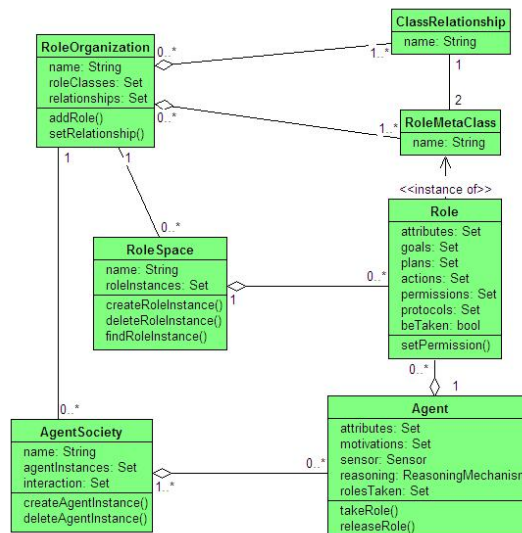

- Is based on the role-based agent formal framework
- Is independent of the application of organizing a conference
- Can be reused for development of other role-based open MAS applications

10/21/2005

CIS Dept., UMass Dartmouth

33

AIPIM

10/21/2005

CIS Dept., UMass Dartmouth

34

Design of the ASPI Model

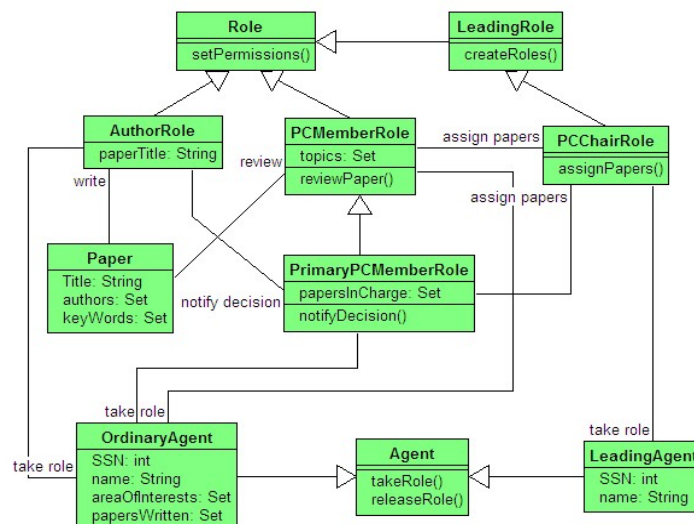

- Define the *LeadingRole* class
 - Each role organization defines a leading role
 - Is responsible for creating other role instances
- Define role classes in role organization
 - *PCChairRole* as a subclass of *LeadingRole*
 - *PCMemberRole*, *PrimaryPCMemberRole*, and *AuthorRole* as subclasses of the *Role* class
- Define *LeadingAgent* and *OrdinaryAgent*

36

Examples of Agent Interaction Protocol (AIP)

Request for Primary PC Member

Request for Paper Reviewer

10/21/2005

CIS Dept., UMass Dartmouth

37

Design of the ASPS Model

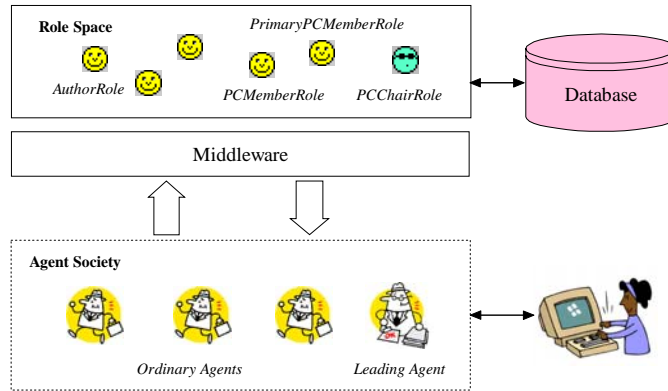

- Design the role space as a server
 - Contains role instances
 - Provides two interfaces: Interface for the leading agent and interface for ordinary agents
- The database server is behind the role space
- Each agent can run on a different machine
 - An agent communicate with the role space through middleware
 - An agent society is chaired by the leading agent
 - Agents communicate with each other using AIP

Choosing the Right Middleware

- Communication support
 - between agents and the role space
 - between the leading agent and ordinary agents
- Middleware functionalities
 - Service provider vs. service consumer
 - Service publisher vs. service subscriber
 - Synchronous vs. asynchronous message passing
 - Security issues
- Middleware options: RMI, CORBA, Sun Jini, Web Services, etc.

49

Conclusions

- A role-based methodology has been proposed for development of open MAS
- The design of roles and agents can be separated, which simplifies agent development
- A three-layered agent development model is proposed
- A prototype of RADE is built to show the feasibility of our approach (in progress)

10/21/2005

CIS Dept., UMass Dartmouth

50

Future Work

- Develop and demonstrate the RADE prototype with case studies
- Design automatic model transformation tools
- Incorporate agent negotiation mechanisms for agent communications
- Develop the Role-based Agent Development Environment (RADE) for rapid application development of open MAS

10/21/2005
